## 10 Abstract

*AssociationExplorer is an open-source interactive R Shiny application designed to help non-technical users explore statistical associations within multivariate datasets. Aimed particularly at journalists, educators, and engaged citizens, the tool facilitates the discovery and interpretation of meaningful patterns between variables without requiring programming or statistical expertise. Users can upload structured data (e.g., from surveys or open government datasets), select relevant variables, and dynamically visualize relationships via a correlation network and contextual bivariate plots. To illustrate its capabilities, we present a case study based on the European Social Survey (ESS), showcasing how users can investigate links between attitudes, behaviors, and socio-demographic indicators across countries. The app supports a range of association measures adapted to variable types (Pearson's  $r$ , Eta, and Cramer's  $V$ ), ensuring both flexibility and statistical rigor. The visual interface enables users to adjust thresholds for association strength and examine results through interactive graphs and summary tables, making the app particularly well-suited for data storytelling, exploratory research, and public communication. AssociationExplorer demonstrates how open-source statistical tooling can enhance transparency, accessibility, and insight in the interpretation of complex social data.*

11 **Keywords:** R Shiny, Exploratory data analysis, Correlation network

22 future directions.

## 23 1. Motivation and significance

24 The growing availability of large, complex, and high-dimensional datasets in  
25 the social sciences and public policy domains offers unprecedented opportu-  
26 nities for insight but also presents significant challenges for exploration and  
27 interpretation, particularly for non-specialist audiences. Journalists, educa-  
28 tors, and engaged citizens often struggle to identify and interpret meaningful  
29 relationships between variables without the aid of programming skills or for-  
30 mal statistical training. This barrier limits the broader societal impact of  
31 open data initiatives, which are designed to promote transparency, account-  
32 ability, and informed public discourse.

33 To address this gap, we developed AssociationExplorer, a free, open-source  
34 R Shiny [3] application that enables intuitive and statistically grounded ex-  
35 ploration of multivariate associations. The tool guides users through a visual  
36 journey of variable relationships by automatically computing appropriate bi-  
37 variate association measures—Pearson’s  $r$ , Eta, and Cramer’s  $V$ —depending  
38 on variable types, and presenting the results in an interactive correlation  
39 network. Users can set thresholds for the strength of association and explore  
40 linked bivariate plots or tables with descriptive labels. This workflow sup-  
41 ports transparent, reproducible, and non-technical exploratory data analysis  
42 (EDA).

43 Our software is particularly suited to survey-based datasets and public opin-  
44 ion studies. As an illustrative case, we apply AssociationExplorer to the  
45 European Social Survey (ESS), a cross-national survey that collects attitudi-  
46 nal, behavioral, and socio-demographic data across European countries. The  
47 tool allows users to uncover associations between trust in institutions, pol-  
48 icy preferences, media usage, and demographic characteristics without any  
49 coding. This type of interactive analysis can empower journalists to build  
50 data-driven narratives, educators to teach statistical thinking, and citizens  
51 to explore evidence underlying public debate.

52 While several tools and libraries exist for correlation analysis (e.g., `corrr` [7],  
53 `GGally` [13], `corrplot` [17], `ggstatsplot` [11], `correlation` [9, 10], `lares` [8]  
54 and `Hmisc` [6] in R [12], or Python packages like `seaborn` [16] and `pingouin`  
55 [15]), they typically require programming proficiency and focus primarily on  
56 numerical associations. Most of these tools do not handle nominal categorical  
57 variables directly; if included, such variables are often transformed using one-  
58 hot or dummy encoding, which can transform their original structure and  
59 limit interpretations.

60 In contrast, AssociationExplorer is designed to handle both quantitative and  
61 qualitative variables (including nominal factors) natively and transparently.  
62 It provides a guided, end-to-end workflow that begins with data upload and  
63 preprocessing, continues through variable selection and association filtering,  
64 and ends with interpretable visualizations. This structured process is in-  
65 tuitive and accessible for users of all backgrounds, making the app espe-  
66 cially suitable for those without programming experience or formal statistical  
67 training. By lowering the technical barrier for statistical exploration, Asso-  
68 ciationExplorer contributes to a more inclusive data culture and supports  
69 data-driven discovery in both academic and public-facing contexts.

## 70 2. Software description

### 71 2.1. Software architecture

72 The AssociationExplorer application is a graphical user interface built with  
73 the R programming language using the Shiny framework. It adopts a mod-  
74 ular, reactive structure where data inputs and user selections dynamically  
75 trigger updates to the visualizations and underlying computations. The user  
76 interface is styled using the `bslib` package [14] with a modern flat theme and  
77 enhanced interactivity through the `shinyjs` [2] and `visNetwork` [1] packages.  
78 The app is structured into distinct tabs: data upload, variable selection, cor-  
79 relation network visualization, pairs plots, and a help section.

80 Upon upload, the dataset is preprocessed to exclude variables with zero vari-  
81 ance, as these variables do not vary across observations and therefore cannot  
82 contribute to meaningful associations or visualizations. Removing them helps  
83 reduce noise and ensures that only informative variables are included in the  
84 analysis. Optionally, the user can provide a variable description file, which  
85 is integrated and used to annotate visual elements. The backend computes  
86 association measures tailored to the variable types: Pearson's  $r$  for numeric  
87 pairs, Cramer's  $V$  for categorical pairs, and the correlation ratio ( $\eta$ ) for mixed  
88 pairs. Associations are filtered using user-defined thresholds and represented  
89 in a correlation network and complementary bivariate plots. The app handles  
90 both CSV and Excel files.

91 The application is currently available as a standalone open-source R Shiny  
92 application on GitHub.<sup>1</sup> It can be launched directly from an R session using  
93 the following command, provided the `shiny` package is installed:

```
94 library(shiny)  
95 runGitHub("AssociationExplorer", "AntoineSoetewey")
```

---

<sup>1</sup><https://github.com/AntoineSoetewey/AssociationExplorer>

96 A fully web-based version, requiring no installation or technical setup, is also  
 97 planned as part of its integration into a broader online platform developed  
 98 within the ODALON (Open multimodal Data for Automated LOcal News)  
 99 research project, which aims to support the production of local news (more  
 100 information about this project in Sections 3 and 4).

## 101 2.2. Software functionalities

102 The major functionalities of the AssociationExplorer application include:

- 103 • **Data upload and cleaning:** The app supports CSV and Excel files.  
 104 It automatically removes variables with only one unique value, as they  
 105 lack variability and cannot contribute to association analyses. Addi-  
 106 tionally, it can optionally integrate user-supplied descriptions of vari-  
 107 ables, which are used to enhance the clarity and interpretability of  
 108 visualizations, particularly for non-technical users. xxx add the fact  
 109 that the description file must contain two columns.
- 110 • **Variable selection interface:** Users can interactively choose which  
 111 variables to explore. When a description file is provided, a summary  
 112 table links variable names to their descriptions.
- 113 • **Dynamic association filtering:** The app computes pairwise associ-  
 114 ation measures between all selected variables, using a method tailored  
 115 to the types of variables involved:
  - 116 – For pairs of numeric variables  $X$  and  $Y$ , the app calculates Pear-  
 117 son’s correlation coefficient ( $r$ ), and retains the association if the  
 118 coefficient of determination ( $R^2$ ) exceeds a user-defined threshold:

$$R^2 = r^2 = (\text{cor}(X, Y))^2 \quad (1)$$

119 where the Pearson’s correlation coefficient  $\text{cor}(X, Y)$  is defined as:

$$r(X, Y) = \frac{\sum_{i=1}^n (X_i - \bar{X})(Y_i - \bar{Y})}{\sqrt{\sum_{i=1}^n (X_i - \bar{X})^2} \sqrt{\sum_{i=1}^n (Y_i - \bar{Y})^2}} \quad (2)$$

120 where  $\bar{X}$  and  $\bar{Y}$  are the sample means of  $X$  and  $Y$ , respectively,  
 121 and  $n$  is the number of observations.

- 122 – For pairs of categorical variables, it computes Cramer’s V, a nor-  
 123 malized measure of association derived from the chi-squared statis-  
 124 tic:

$$V = \sqrt{\frac{\chi^2}{n \cdot \min(k-1, r-1)}} \quad (3)$$

where  $\chi^2$  is the chi-squared statistic,  $n$  is the total number of observations, and  $k, r$  are the numbers of categories in each variable.

- For mixed pairs (one numeric and one categorical variable), the app computes the correlation ratio ( $\eta$ ), which quantifies how much of the variance in the numeric variable is explained by the grouping structure of the categorical variable. It is defined as:

$$\eta = \sqrt{\frac{SS_{\text{between}}}{SS_{\text{total}}}} \quad (4)$$

where:

- $SS_{\text{total}}$  is the *total sum of squares* of the numeric variable:

$$SS_{\text{total}} = \sum_{i=1}^n (y_i - \bar{y})^2$$

with  $y_i$  the observed numeric values and  $\bar{y}$  their overall mean.

- $SS_{\text{between}}$  is the *between-group sum of squares*, computed as:

$$SS_{\text{between}} = \sum_{g=1}^G n_g (\bar{y}_g - \bar{y})^2$$

where  $G$  is the number of groups (categories),  $n_g$  is the number of observations in group  $g$ ,  $\bar{y}_g$  is the group mean, and  $\bar{y}$  is the overall mean.

This formulation captures the proportion of the total variance in the numeric variable that can be attributed to differences between the categorical groups. A pair is retained only if  $\eta^2$  exceeds the numeric threshold defined by the user.

Each association is retained only if its corresponding strength metric— $R^2$ ,  $\eta^2$ , or Cramer’s V—exceeds the threshold set by the user. These thresholds can be adjusted interactively through the interface, and the filtering process is reactive: updates to the thresholds immediately propagate to the network and bivariate visualizations. This allows users to dynamically control the sensitivity of the association analysis and focus on relationships of substantive interest.

- 149 • **Interactive correlation network:** The filtered associations are displayed as an interactive graph where nodes represent variables and edges represent associations. Edge thickness and length reflect the strength of the association: stronger associations are shown with thicker and shorter edges, whereas weaker associations are displayed with thinner and longer edges. This dual visual representation helps users quickly identify the most meaningful relationships in the network. Variable descriptions are displayed when the user hovers over a node in the network, allowing for quick access to additional context without cluttering the visualization. The network is built using the `visNetwork` R package, which supports interactive, customizable graph layouts; full documentation is available at <https://datastorm-open.github.io/visNetwork/>. xxx add blue/red colors of edge.
- 162 • **Bivariate visualization of variable pairs:** For each variable pair exceeding the threshold:
  - 164 – Scatter plots with linear regression lines are shown for numeric pairs, helping visualize the direction and strength of the relationship.
  - 166 – Colored contingency tables with marginal sums are shown for categorical pairs, where cell background colors vary in intensity according to the frequency of observations, using a blue gradient to highlight higher counts.
  - 168 – Mean plots are shown for numeric-categorical pairs, with bars ordered by mean value to make it easy to compare and rank categories based on the quantitative variable.
- 174 Confidence intervals for the regression lines and standard errors in the mean plots are intentionally omitted to maintain a clean, uncluttered visualization that prioritizes ease of interpretation. Mean plots were selected over boxplots to avoid overwhelming non-expert users with distributional information, focusing instead on clear, accessible insights about average group differences.
- 180 • **Accessibility and user guidance:** A dedicated help section explains each step, allowing users with a limited statistical background to actively explore their data.

### 183 2.3. Sample code snippets analysis

184 Below is a representative snippet from the application showing how the software selects the appropriate association measure depending on the types of  
 185 the variable pair and filters associations based on user thresholds:  
 186

```

187 # Numeric vs numeric case
188 if (is_num1 && is_num2) {
189     ...
190     r <- cor(x, y, use = "complete.obs")
191     cor_val <- ifelse(r^2 >= threshold_num, r, 0)
192     cor_type <- "Pearson's r"
193
194 # Categorical vs categorical case
195 } else if (!is_num1 && !is_num2) {
196     ...
197     tbl <- table(x, y)
198     ...
199     n_obs <- sum(tbl)
200     df_min <- min(nrow(tbl) - 1, ncol(tbl) - 1)
201     if (df_min > 0) {
202         v_cramer <- sqrt(chi$statistic / (n_obs * df_min))
203         cor_val <- ifelse(v_cramer >= threshold_cat,
204                           v_cramer, 0)
205         cor_type <- "Cramer's V"
206     }
207
208 # Mixed case (numeric vs categorical)
209 } else {
210     ...
211     means_by_group <- tapply(num_var, cat_var,
212                               mean, na.rm = TRUE)
213     overall_mean <- mean(num_var, na.rm = TRUE)
214     n_groups <- tapply(num_var, cat_var, length)
215     bss <- sum(n_groups * (means_by_group - overall_mean)^2,
216               na.rm = TRUE)
217     tss <- sum((num_var - overall_mean)^2, na.rm = TRUE)
218
219     if (tss > 0) {
220         eta <- sqrt(bss / tss)
221         cor_val <- ifelse(eta^2 >= threshold_num, eta, 0)
222         cor_type <- "Eta"
223     }
224 }

```

225 This conditional structure ensures that the correct statistical method is ap-  
226 plied for each type of variable pair, supporting a robust and interpretable

227 exploration of associations.

### 228 3. Illustrative example

229 To demonstrate the core functionalities of AssociationExplorer, we use a cu-  
230 rated subset of data from the European Social Survey (ESS), Round 11.  
231 The ESS is a large-scale, cross-national survey that measures attitudes, be-  
232 liefs, and behaviors across European countries. The original dataset includes  
233 responses from over 46,000 individuals on topics such as politics, trust, well-  
234 being, media use, and health. The full ESS dataset, codebook, and docu-  
235 mentation are freely available at <https://ess.sikt.no/en/> [5, 4].

236 For this example, we focus on the Belgian respondents, resulting in a re-  
237 duced dataset of 1,594 individuals. We selected 60 variables covering areas  
238 highly relevant for understanding public opinion and everyday life in Belgium:  
239 interest in politics, confidence in institutions, lifestyle behaviors, perceived  
240 discrimination, vaccination, and more. These variables include both numbers  
241 (quantitative data) and labels or categories (qualitative data), making the  
242 dataset ideal for exploring diverse forms of associations.

243 This example is particularly relevant for our research project ODALON,  
244 which aims to develop a platform that supports the (semi-)automated pro-  
245 duction of local news in Belgium. AssociationExplorer plays a key role in  
246 this effort by offering journalists, researchers, and citizens an intuitive tool to  
247 explore potentially newsworthy patterns in public and survey data, without  
248 requiring programming skills or statistical training.

249 Data preparation for the curated dataset was carried out in R and included:

- 250 • Filtering the dataset to include only Belgian respondents.
- 251 • Converting survey-specific nonresponse codes (e.g., 77, 88, 9999, etc.)  
252 to NA values, based on the ESS codebook.
- 253 • Reversing response scales to ensure consistency (e.g., higher values al-  
254 ways indicate stronger agreement or frequency).
- 255 • Recoding several categorical variables to have meaningful and inter-  
256 pretable labels (e.g., for gender, religion, political participation, or  
257 health behaviors).

258 The full R script used to perform this transformation is openly available in the  
259 data folder of the GitHub repository at [https://github.com/AntoineSoetewey/](https://github.com/AntoineSoetewey/AssociationExplorer/tree/main/shiny_app/data)  
260 [AssociationExplorer/tree/main/shiny\\_app/data](https://github.com/AntoineSoetewey/AssociationExplorer/tree/main/shiny_app/data).

261 Once the dataset is uploaded into AssociationExplorer via the Data tab (see  
262 Figure ??), users are guided through a step-by-step process. In addition

263 to the main dataset, users can optionally upload a separate description file  
 264 that provides human-readable explanations for each variable. In our exam-  
 265 ple, this file was created using information from the official ESS codebook,  
 266 allowing for clearer interpretation throughout the app interface. If no de-  
 267 scription file is provided, the application will automatically use the vari-  
 268 able names themselves as default labels in all visualizations and summary  
 269 tables. In the **Variables** tab, they select the variables they wish to ex-  
 270 plore, optionally assisted by a table of the variables' names and descriptions  
 271 (see Figure ??). Next, users can adjust the association thresholds in the  
 272 **Correlation Network** tab to focus on the most meaningful relationships  
 273 among the selected variables (see Figure ??). Finally, the **Pairs Plots** tab  
 274 displays detailed bivariate visualizations, including scatter plots, mean plots,  
 275 and contingency tables, for each retained association (see Figure ??).  
 276 This example shows how non-expert users, such as journalists or engaged cit-  
 277 izens, can uncover unexpected or important relationships in a public opinion  
 278 dataset. These insights can serve as the starting point for local news, public  
 279 debates, or policy communication.  
 280 Note that in this example, no survey weights have been applied. While the  
 281 ESS dataset includes weights to account for complex sampling designs, we  
 282 chose not to use them here in order to maintain clarity and responsiveness  
 283 in the interface, and because our focus is on demonstrating the app's core  
 284 functionality rather than producing nationally representative statistics.  
 285 xxx to do: add screenshots and refer to them.  
 286 xxx to do: add video : **Optional:** *you may include one explanatory video or*  
 287 *screencast that will appear next to your article, in the right hand side panel.*  
 288 *Please upload any video as a single supplementary file with your article. Only*  
 289 *one MP4 formatted, with 150MB maximum size, video is possible per article.*  
 290 *Recommended video dimensions are 640 x 480 at a maximum of 30 frames*  
 291 */ second. Prior to submission please test and validate your .mp4 file at [http:](http://elsevier-apps.sciverse.com/GadgetVideoPodcastPlayerWeb/verification)*  
 292 *[//elsevier-apps.sciverse.com/GadgetVideoPodcastPlayerWeb/verification](http://elsevier-apps.sciverse.com/GadgetVideoPodcastPlayerWeb/verification)*  
 293 *. This tool will display your video exactly in the same way as it will appear*  
 294 *on ScienceDirect.*

## 295 4. Impact

296 AssociationExplorer enables a broader range of users, including researchers,  
 297 students, journalists, and engaged citizens, to explore complex datasets in-  
 298 volving both quantitative and qualitative variables. By eliminating the need  
 299 for advanced programming or statistical knowledge, the software lowers the  
 300 barrier to entry for data-driven discovery and interpretation.

301 From a research perspective, the app facilitates the systematic screening of  
 302 pairwise associations in survey or public data, offering insights that can guide  
 303 hypothesis generation, variable selection, or further multivariate modeling.  
 304 It is planned to be used in the context of the ODALON research project,  
 305 which aims to support the semi-automated generation of local news. Ini-  
 306 tially targeted at Belgian journalists, the platform, and the use of Associa-  
 307 tionExplorer within it, may later be extended to other professional or public  
 308 audiences. The app will help identify patterns in public opinion data that  
 309 may serve as starting points for local news articles, for example, by revealing  
 310 unexpected associations between political attitudes, trust in institutions, or  
 311 lifestyle behaviors.

312 The software also improves the pursuit of existing research questions by mak-  
 313 ing it easier to assess relationships between variables of different types (nu-  
 314 meric, ordinal, and nominal) within a single unified interface. Unlike many  
 315 tools that require preprocessing steps such as dummy coding, Association-  
 316 Explorer handles categorical variables natively and automatically selects the  
 317 appropriate statistical association measure (i.e., Pearson’s  $r$ , Cramer’s  $V$ ,  
 318 correlation ratio  $\eta$ ). This ensures that users can obtain meaningful and in-  
 319 terpretable results without needing to master complex preprocessing steps or  
 320 statistical diagnostics.

321 The app is also planned to be used as an interactive teaching aid in statistics  
 322 and data literacy courses. It will allow students to upload real datasets and  
 323 immediately visualize how variables relate, reinforcing theoretical concepts  
 324 through intuitive, hands-on exploration. By presenting associations visually,  
 325 the app encourages learners to engage with their data more actively and  
 326 reflect critically on patterns, variable relationships, and data quality.

327 Although already fully functional, the software is currently made available as  
 328 a standalone open-source R Shiny application on GitHub and can be launched  
 329 directly from R. At this stage, it is therefore only accessible to users who have  
 330 R installed on their machine. As part of the broader ODALON research  
 331 project, which aims to build an integrated platform combining multiple tools  
 332 for automated local news production, AssociationExplorer will serve as a key  
 333 building block. A public, fully online version of the app will be released as the  
 334 project progresses, and no later than December 2026 (which corresponds to  
 335 the end of the project), ensuring that anyone, including those without access  
 336 to R, can freely use the application through a user-friendly web interface.

337 Future impact is expected through integration into platforms for civic data  
 338 storytelling, local journalism, and public communication. While not intended  
 339 for commercialization, the application’s role in supporting open, inclusive,  
 340 and responsible data exploration reflects its potential for broader societal  
 341 relevance.

## 342 5. Conclusions

343 AssociationExplorer provides a user-friendly, open-source solution for explor-  
344 ing statistical associations within multivariate datasets. By integrating ro-  
345 bust statistical measures with dynamic and intuitive visualizations, the app  
346 empowers non-expert users, such as journalists, educators, and engaged cit-  
347 izens, to uncover patterns and relationships that might otherwise remain  
348 hidden. Its ability to handle both quantitative and qualitative variables,  
349 combined with an interactive interface and an easy-to-follow workflow, makes  
350 it especially suitable for exploratory research, data storytelling, and public  
351 communication.

352 Beyond its technical features, the application contributes to democratizing  
353 access to statistical tools and supports data literacy in a wide range of con-  
354 texts. The case study using the European Social Survey illustrates how users  
355 can navigate from raw data to meaningful insights with minimal technical  
356 knowledge.

357 While the app is currently accessible through R for users with basic technical  
358 setup, a fully web-based version will make it universally available as part of  
359 a broader data exploration platform being developed under the ODALON  
360 project. By lowering barriers to data exploration and interpretation, Asso-  
361 ciationExplorer supports more inclusive, transparent, and evidence-informed  
362 engagement with complex social data.

363 Future improvements will be guided by user feedback and community con-  
364 tributions. One planned feature is the ability to incorporate user-specified  
365 weights, especially relevant for survey data. However, this functionality is  
366 not yet implemented in the current version to preserve simplicity and ensure  
367 responsiveness in the user interface, particularly for users unfamiliar with  
368 survey weighting procedures.

369 Additional avenues for future research and development include extending  
370 the application to compute partial correlations, which can help isolate direct  
371 relationships between variables by controlling for confounders. Visualizations  
372 involving three variables could also be introduced, for instance, scatter plots  
373 where the size or color of points reflects a third variable, to uncover more nu-  
374 anced patterns. Furthermore, users could be allowed to filter variables based  
375 on missingness thresholds or variable types, and a module for longitudinal  
376 data (e.g., panel structures or time series) could expand the app’s relevance  
377 to temporal analyses. Lastly, adding options for exporting results or gener-  
378 ating automated summaries of key associations could further enhance its use  
379 in reporting and collaborative workflows.

380 A more ambitious extension would integrate a large language model (LLM)  
381 to enable users to enter a free-text prompt or a thematic query. The app

would then automatically identify variables that are semantically similar or potentially associated with the theme, based on the dataset and the optional description file provided by the user. These extracted variables would be pre-selected in the interface, as if the user had chosen them manually, after which the analysis would proceed as in the current version. This feature could significantly enhance accessibility for users unfamiliar with the dataset or its structure, and accelerate the discovery of relevant associations.

## Acknowledgements

The authors gratefully acknowledge the Walloon region and the SPW Recherche in Belgium for funding the ODALON research project. The authors additionally thank the researchers from UCLouvain Saint-Louis Brussels involved in the Beamm research project for their feedback on previous versions of the software.
